Course module description:

This module aims to show how to apply the theory of language translation introduced in the prerequisite courses to build compilers and interpreters. It covers the building of translators both from scratch and using compiler generators. In the process, the module also identifies and explores the main issues of the design of translators. Topics include compiler design, lexical analysis, parsing, symbol tables, declaration and storage management, code generation. The construction of a compiler/interpreter for a small language is a necessary component of this module, so students can obtain the necessary skills.

Textbook:

Title: Compiler Design

Author(s): Kaushal Kishor Rastogi

Publisher: New Delhi: Global Academic Publishers & Distributors

Year of Publication: 2014

Support material (s):

Slides: MIT Computer Language Engineering Courseware

Teaching methods:

Lectures, tutorials, problem solving, laboratory

Duration: 15 weeks, 45 hours in total

Lectures: 36 hours

Tutorials: 06 hours

Laboratory: 03 hours

Learning outcomes:

- **Knowledge and understanding**
 - A1. Know and Understand basics of automata theory
 - A2. Know and understand the mission, principle and the structure of translators
 - A3. Know and Understand the relevant basic concepts inherent to translators, their components, the difference between compilers and interpreters, the difference between LL(1), LR (1), and SLR grammars, the difference between bottom up and top down parsers.
 - A4. Know and understand the mission of editors, compilers, linkers, loaders and their interaction.
- **Cognitive Skills (thinking and analysis).**
 - B1. Analyze and Compare bottom up and top down parsing
 - B2. Design a compiler for a simple programming language.
- **Practical Skills**
 - C1. Plan and undertake a group project in the area of compilers
 - C2. Prepare and deliver a written project technical report
 - C5. Implement specific components of translators
 - C6. Practice and use lexical and syntactic tool generators
- **Transferable Skills and Personal Qualities**
 - D1. Display an integrated approach to the deployment of communication skills, use IT skills and display mature computer literacy
 - D2. Use IT skills and display mature computer literacy
 - D6. Employ discrete mathematical skills (automata theory)

Learning Outcomes Achievements:

Development

A1, A2, A3, A4, B1 and D6 are developed through lectures, and tutorials.
 B2, C1, C2, D1 and D2 are developed through assignments, seminars and projects.
 C5, C6 are developed through lab works and projects.

Assessment:

A1, A2, A3, A4, B1 and D6 are assessed by quizzes and examinations.
 B2, C1, C2, C5, C6, D1 and D2 are assessed by projects and lab works.

Assessment instruments

- Quizzes.& Home works
- Final examination: 40 marks

<u>Allocation of Marks</u>	
Assessment Instruments	Mark
First Examination	20
Second Examination	20
Final Examination	40
Quizzes, Home works	20
Total	100

Assignments All assignments will be announced or handed out in class. Many assignments will require programming in Python. All individual assignments, whether programming or not, are to be done individually. While you may discuss the assignment in general terms with others, your

solutions should be composed, designed, written and tested by you alone. If you need help, consult the TA or the instructor.

Documentation and academic honesty

Submit your home work covered with a sheet containing your name, number, course title and number, and type and number of the home work (e.g. tutorial, assignment, and project).

Any completed homework must be handed in to my office (room IT 602) by 15:00 on the due date. After the deadline “zero” will be awarded. You must keep a duplicate copy of your work because it may be needed while the original is being marked.

You should hand in with your assignments:

- 1- A printed listing of your test programs (if any).
- 2- A brief report to explain your findings.
- 3- Your solution of questions.

For the research report, you are required to write a report similar to a research paper. It should include:

- **Abstract:** It describes the main synopsis of your paper.
- **Introduction:** It provides background information necessary to understand the research and getting readers interested in your subject. The introduction is where you put your problem in context and is likely where the bulk of your sources will appear.
- **Methods (Algorithms and Implementation):** Describe your methods here. Summarize the algorithms generally, highlight features relevant to your project, and refer readers to your references for further details.
- **Results and Discussion (Benchmarking and Analysis):** This section is the most important part of your paper. It is here that you demonstrate the work you have accomplished on this project and explain its significance. The quality of your analysis will impact your final grade more than any other component on the paper. You should therefore plan to spend the bulk of your project time not just gathering data, but determining what it ultimately means and deciding how best to showcase these findings.
- **Conclusion:** The conclusion should give your reader the points to “take home” from your paper. It should state clearly what your results demonstrate about the problem you were tackling in the paper. It should also generalize your findings, putting them into a useful context that can be built upon. All generalizations should be supported by your data, however; the discussion should prove these points, so that when the reader gets to the conclusion, the statements are logical and seem self-evident.
- **Bibliography:** Refer to any reference that you used in your assignment. Citations in the body of the paper should refer to a bibliography at the end of the paper.

• Protection by Copyright

1. Coursework, laboratory exercises, reports, and essays submitted for assessment must be your own work, unless in the case of group projects a joint effort is expected and is indicated as such.
2. Use of quotations or data from the work of others is entirely acceptable, and is often very valuable provided that the source of the quotation or data is given. Failure to provide a source or put quotation marks around material that is taken from elsewhere gives the appearance that the comments are ostensibly your own. When quoting word-for-word from the work of another person quotation marks or indenting (setting the quotation in from the margin) must be used and the source of the quoted material must be acknowledged.
3. Sources of quotations used should be listed in full in a bibliography at the end of your piece of work.

• Avoiding Plagiarism.

1. Unacknowledged direct copying from the work of another person, or the close paraphrasing of somebody else's work, is called plagiarism and is a serious offence, equated with cheating in examinations. This applies to copying both from other students' work and from published sources such as books, reports or journal articles.
2. Paraphrasing, when the original statement is still identifiable and has no acknowledgement, is plagiarism. A close paraphrase of another person's work must have an acknowledgement to the

source. It is not acceptable for you to put together unacknowledged passages from the same or from different sources linking these together with a few words or sentences of your own and changing a few words from the original text: this is regarded as over-dependence on other sources, which is a form of plagiarism.

3. Direct quotations from an earlier piece of your own work, if not attributed, suggest that your work is original, when in fact it is not. The direct copying of one's own writings qualifies as plagiarism if the fact that the work has been or is to be presented elsewhere is not acknowledged.
4. Plagiarism is a serious offence and will always result in imposition of a penalty. In deciding upon the penalty the Department will take into account factors such as the year of study, the extent and proportion of the work that has been plagiarized, and the apparent intent of the student. The penalties that can be imposed range from a minimum of a zero mark for the work (without allowing resubmission) through caution to disciplinary measures (such as suspension or expulsion).

Course/module academic calendar

week	Basic and support material to be covered	Homework/reports and their due dates
(1)	Introduction to Translators and Compilers	
(2)	Lexical Analysis: Introduction , Regular Expressions, Grammar language	
(3)	Lexical Analysis: Finite Automata (DFA, NFA), Lex: Lexical generator tool	
(4)	Tutorial1: Handwritten Lexical Analyzer Syntactic Analysis: Introduction	
(5)	Syntactic Analysis: Bottom Up Parsing Shift reduce parsing	Implementation of a hand written lexical analyzer
(6) First exam.	Shift Reduce parsing Parse table	
(7)	Tutorial2 Syntax Analysis: Top Down Parsing (1)	
(8)	Syntax Analysis: Top Down Parsing (2)	
(9)	Tutorial3 Semantic Analysis: Introduction	
(10)	Type Checking (1)	Implementation of a simple calculator using lex/yacc tools
(11) Second exam.	Type checking (2) Tutorial 4	
(12)	Intermediate Representation (1)	
(13)	Intermediate Representation (2) Tutorial 5	
(14)	Machine Code Generation (1)	
(15)	Machine Code Generation (2) Tutorial 6	
(16) Final Exam.	Revision	

Expected workload:

On average students need to spend 2 hours of study and preparation for each 50-minute lecture/tutorial.

Attendance policy:

Absence from lectures and/or tutorials shall not exceed 15%. Students who exceed the 15% limit without a medical or emergency excuse acceptable to and approved by the Dean of the relevant college/faculty shall not be allowed to take the final examination and shall receive a mark of zero for the course. If the excuse is approved by the Dean, the student shall be considered to have withdrawn from the course.
